### **DETAILED ACTION**

## Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed (on 25 September 2006) in this application after final rejection (mailed 23 January 2006). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 25 September 2006 has been entered.

# Priority

Acknowledgment is made of applicant's claim for foreign priority under 35
 U.S.C. 119(a)-(d). The certified copy has been filed in parent Application No. 09/377,405, filed on 20 August 1999.

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Norman et al (US 5,719,589 A) in view of Sumi et al (US 6,169,532 B1).

Regarding claim 1, Norman discloses a driving method of a light-emitting display [Fig. 1; 10] in which light-emitting elements are connected to intersections of positive electrode lines [Fig. 3; 14] and negative electrode lines [Fig. 3; 13] arranged in a matrix, either one of said positive electrode lines or said negative electrode lines are employed as scan lines [Fig. 3; 13] with the other employed as drive lines [Fig. 3; 14], said driving method comprising; while scanning [Fig. 3; 42] the scan lines, connecting [Fig. 3; 36] drive sources [Fig. 3; 37] to desired drive lines in synchronization with the scanning, whereby allowing the light-emitting elements connected to the intersections of the scan lines and drive lines to emit light; and during a reset period after a scan period for scanning an arbitrary scan line is complete and before scanning the following scan line is started, applying a first reset voltage [Fig. 3; V<sub>R</sub>] to all of said scan lines and applying a second reset voltage [Fig. 3; V<sub>C</sub>] that is greater than said first reset voltage to all of said drive lines (see Column 5, Line 46 - Column 8, Line 53).

Norman does not expressly disclose scanning the following scan line immediately after the reset period in which the first reset voltage is applied to all of said scan lines and the second reset voltage is applied to all of said drive lines.

However, Sumi does disclose during a reset period [i.e., between image display frames] after a scan period for scanning an arbitrary scan line [Fig. 10; 17 -- the bottom line in the first frame, for instance] is complete and before scanning the following scan line [Fig. 10; 17 -- the top line in the second frame, for instance] is started, applying a first reset voltage [Fig. 10; Vg = 0] to all of said scan lines and applying a second reset voltage [Fig. 10; via 35] to all of said drive lines; and scanning the following scan line immediately after the reset period in which the first

reset voltage is applied to all of said scan lines and the second reset voltage is applied to all of said drive lines (see Column 13, Line 63 - Column 14, Line 39).

Norman and Sumi are analogous art, because they are from the shared inventive field of driving organic electroluminescent and LED display devices. Therefore, it would have been obvious to one having ordinary skill in the art at the time of invention to use Sumi's resetting period technique with Norman's light-emitting display device, so as to eliminate residual potentials on the display electrodes.

Regarding claim 2, Norman discloses the difference between said second reset voltage and said first reset voltage is set to be lower than the light emission threshold voltage of said light-emitting element (see Column 7, Lines 3-18).

Regarding claim 3, Norman discloses said drive lines are connectable to either said drive source or a second reset voltage source [Fig. 3; V<sub>C</sub>] for providing said second reset voltage, said scan lines are connectable to either a first reset voltage source [Fig. 3; V<sub>R</sub>] for providing said first reset voltage or a reverse bias voltage source [Fig. 3; 45, 48] for providing a predetermined reverse bias potential (see Column 7, Line 3 - Column 8, Line 53).

Regarding claim 4, this claim is rejected by the reasoning applied in rejecting claim 3.

Regarding claim 5, Norman discloses said first reset voltage source provides a ground potential (see Column 7, Lines 3-34 and Column 8, Lines 1-36).

Regarding claim 6, this claim is rejected by the reasoning applied in rejecting claim 5.

Regarding claim 7, Norman discloses said reverse bias voltage sources are to have a same voltage as the voltage value determined by subtracting said second reset voltage from light emission specifying voltages of light-emitting elements (see Column 8, Lines 1-36).

Regarding claim 8, this claim is rejected by the reasoning applied in rejecting claim 7.

Regarding claim 9, this claim is rejected by the reasoning applied in rejecting claim 7.

Regarding claim 10, this claim is rejected by the reasoning applied in rejecting claim 7.

Regarding claim 11, Norman discloses said drive lines are connectable to either one of said drive sources, the second reset voltage source for providing said second reset voltage, or a grounding means for providing a ground potential, said scan lines are connectable to either the first reset voltage source for providing said first reset potential or the reverse bias voltage source for providing a predetermined reverse bias potential (see Column 7, Line 3 - Column 8, Line 53).

Regarding claim 12, this claim is rejected by the reasoning applied in rejecting claim 11.

Regarding claim 13, this claim is rejected by the reasoning applied in rejecting claim 5.

Regarding claim 14, this claim is rejected by the reasoning applied in rejecting claim 5.

Regarding claim 15, Norman discloses said reverse bias voltage source has a same voltage as the light emission specifying voltage of light-emitting elements (see Column 7, Lines 3-18).

Regarding claim 16, this claim is rejected by the reasoning applied in rejecting claim 15.

Regarding claim 17, this claim is rejected by the reasoning applied in rejecting claim 15.

Regarding claim 18, this claim is rejected by the reasoning applied in rejecting claim 15.

## Response to Arguments

5. Applicant's arguments filed 25 September 2006 and 12 July 2006 have been fully considered but they are not persuasive.

The applicant contends the cited prior art of Norman et al (US 5,719,589 A) neglects teaching the difference between said second reset voltage and said first reset voltage is set to be lower than the light emission threshold voltage of said light-emitting element (see Page 9 of the Amendments submitted 25 September 2006 and 12 July 2006). However, the examiner respectfully disagrees.

Art Unit: 2629

Norman explicitly discloses the difference between said second reset voltage and said first reset voltage is set to be lower than the light emission threshold voltage of said light-emitting element (see Column 7, Lines 3-18). Norman states, "column rest potential [Fig. 3;  $V_C$ ] is taken from power source [Fig. 3;  $V_C$ ] although, as will be explained presently, column rest potential [Fig. 3;  $V_C$ ] (combined with a row rest potential [Fig. 3;  $V_R$ ]) can be any potential below a level where individual LEDs of array 10 will turn ON" (see Column 7, Lines 3-18).

Any non-zero voltage could be used as Norman's column rest potential [Fig. 3;  $V_C$ ] and read on the instantly claimed subject matter; but -33 volts is given as one non-limiting example by Norman (see Column 8, Line 15). Furthermore, although Norman prefers using rest potentials to place unselected light emitting diodes [Fig. 3; 15] in a "reverse bias condition" (see Column 7, Line 30), Norman makes it plain the invention's only limiting factor is, "the column rest potential being below a level where individual light emitting diodes of the plurality of light emitting diodes will turn ON" (see Column 10, Lines 1-4). Therefore, the row rest potential may be provided by an open terminal/circuit (see Column 6, Lines 58-59; i.e.,  $V_R = 0$  volts). As such, the difference (i.e. the amount by which the two quantities differ from one another is -33 volts) between said second reset voltage [Fig. 3;  $V_C = -33$  volts] and said first reset voltage [Fig. 3;  $V_R = 0$  volts] is set to be lower than the light emission threshold voltage of said light-emitting element.

Applicant's arguments with respect to claims 1-18 have been considered but are moot in view of the new ground(s) of rejection.

By such reasoning, rejection of the claims is deemed necessary, proper, and thereby maintained at this time.

### Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Yamashita (US 6,903,712 B1), Kono et al (US 6,191,764 B1), Fujisaki et al (US 5,973,655 A), Bird et al (US 5,852,425 A), Helgeson (US 5,530,457 A), and Leventis et al (US 5,444,330 A) are cited to further evidence the state of the art pertaining to driving methods of light-emitting displays.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jeff Piziali whose telephone number is (571) 272-7678. The examiner can normally be reached on Monday - Friday (6:30AM - 3PM).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Bipin Shalwala can be reached on (571) 272-7681. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
